

The Extek 3441 Silver Duplicator is designed for acetate base film duplication. Some of the key differences in this unit vs other silver duplicators are as follows:

** There is no vacuum chamber*

** It has a glass cylinder and belt much like that of a Diazo duplicator **

It has variable speed and variable exposure.

In some cases, we've seen the speed set to 25 Ft. per minute for acetate film due to its condition. The same appearing images on polyester would allow for a speed of 300 to 350 Ft. per minute.
